MUNNI MUNNI PLATINUM-PALLADIUM DRILLING PROGRAMME

Legend Mining Limited and East Coast Minerals NL advise that the first stage of the platinum-palladium drilling programme on their Munni Munni Joint Venture has been completed.

A total of 3171.8 meters was drilled consisting of 28 holes using both RC precollars and diamond coring through the Ferguson Reef mineralisation.

Currently the core is being logged and cut on site.

Core samples from the first seven holes have already been despatched to the laboratory for platinum, palladium, gold, nickel and copper analyses and the remainder will be sent within the next week.

The purpose of the drilling programme is to establish continuity of the reef downdip from the mapped outcrop, the thickness of the reef and platinum-palladium grades within the Joint Venture ground.

It is anticipated that a resource estimate will be prepared prior to the end of November 2001.
